Helping Growers *and* the Planet

Our technology improves farm outcomes and addresses the critical issue of food security.

Explore the components of the sensor by rolling over the red dots

Solving Real World Problems

Decision making in commercial farming today relies almost entirely on data provided by technology. But pollination got left behind. Our technology exists to address this oversight by giving farmers the critical information they need to be more efficient and more cost-effective. Mouse over the cutaway to explore the different components of the sensor.

It All Starts in the Hive

The BeeHero In-Hive sensor enables the remote monitoring of beehives on a large scale (millions of hive The sensor monitors hive temperature, humidity, colony acoustics, magnetic field, hive position, and orientation. The unit is maintenance-free and has a multi-year lifespan. The data

And Continues In the Field

Our newly redesigned and custom built PIP In-Field sensor boasts significantly enhanced audio capability, resulting in more precise detection of the acoustic signature of bees. The new design also features improved filtering of background interference from wind, traffic, and other farm equipment noise. The In-Field sensors are robust, user-friendly, plug-and-play devices, easily deployed in any field or orchard environment. The redesigned enclosure features larger batteries for improved

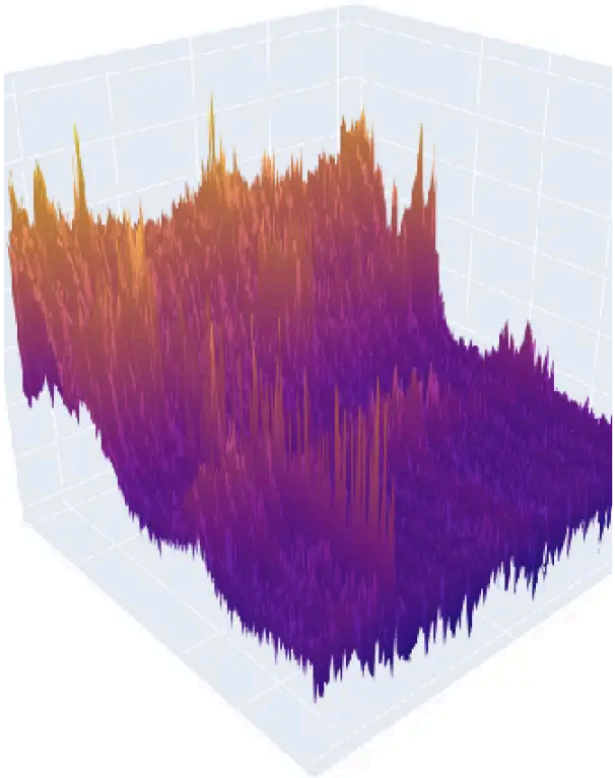

transferred to a Gateway unit via BLE 5.1.

And On to the Cloud

The Gateway logs the data from the sensors and transmits it directly to the cloud using its onboard cellular modem. It also collects local information including sound, microclimate data, sensor position, relative location, and more.

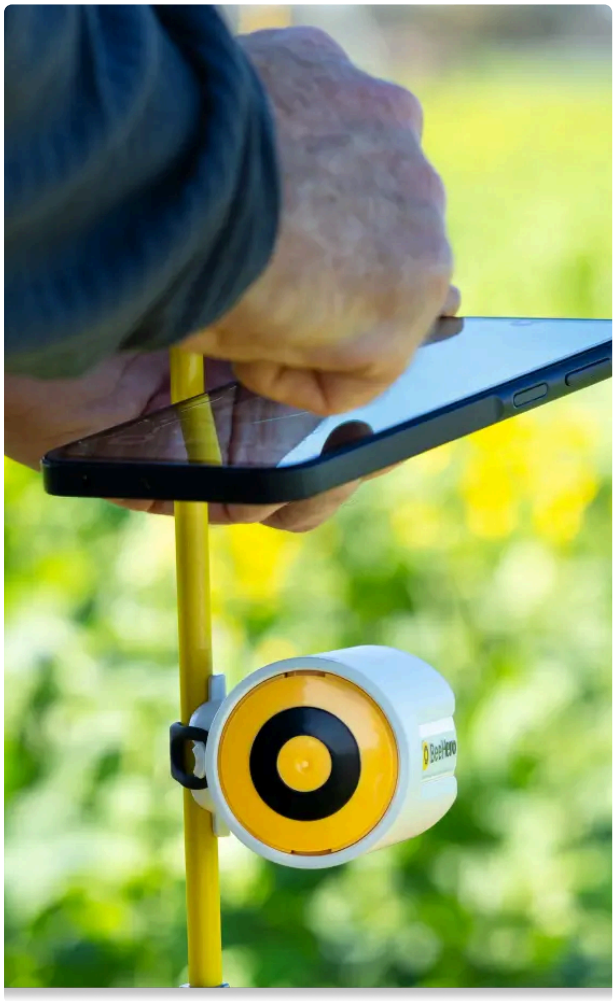

Nature is Really Big, So We Needed a Really Large Data Set!

Mother nature is unpredictable, and since our goal is prediction, we need large data sets to successfully train our algorithms. By building a data collection infrastructure that is inexpensive to produce, and easy to deploy, we are able to generate a very large volume of raw data from the field.

BeeHero has spent the last five years building the largest database of bees and pollination in the world. This

thousands of hives in order to better understand the intricacies of the biological processes occurring both inside and outside of the colony.

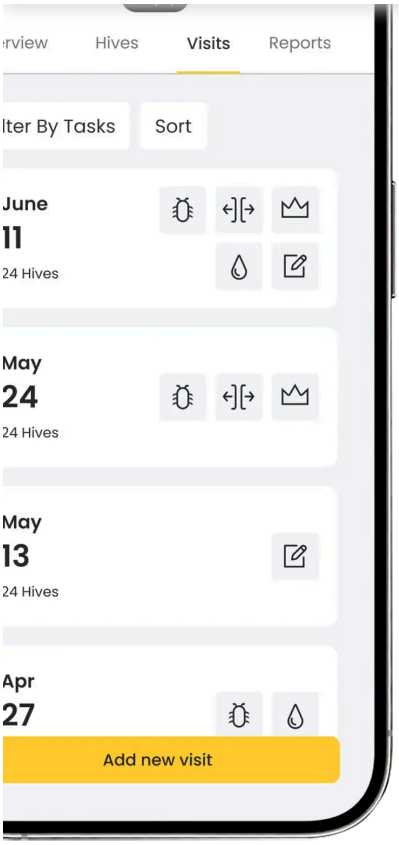

Turning Data Into Information

Our Machine Learning models predict colony issues and measures bee activity and pollination efficiency and transforms it into valuable, actionable insights. We use a range of techniques to address multiple problems in different development stages, including Linear Regression, SVM, Naive Bayse, KNN, and

independent units to make predictions.

The BeeHero Beekeeper Mobile App

If anyone knows the value of a good tool, it’s a beekeeper! Our mobile app turns all of this technology into a powerful tool to help beekeepers manage their operations more efficiently.

All the Features You Need

Dates and times of treatments, feedings, and when each hive was last visited — plus informa on splits. An alert tells you when a hive has bee opened.

The Dashboard

The dashboard is the online portal where growers can sign up to work with BeeHero. Once onboarded, growers have

Starting with outlining a grower's orchard by using a combination of simple drawing tools and the familiar interface of Google Maps, the platform takes growers all the way through ordering, selecting hive drop sites, and identifying field access points. There are five key elements to the platform:

Platform Features

+ Orchard Creation

+ Drop Maps/Logistics

+ The Bee Calculator

+ The Pollination Dashboard

+ End of Season Report
